

TBA

Turbo Blowers

Features

- Integral molded scroll design
- Turbine bladed impeller
- Steel inlet guard
- Precisely balanced impellers eliminate vibration
- Complete line of available accessories for adapting to any piping condition or operational requirement
- More abrasion resistant than steel blower housing

Benefits

- Efficiencies of up to 50% over conventional blowers
- Meets air volume and pressure requirements with smaller horsepower
- Reduced power consumption
- Easily rotated to any of 14 available positions
- Corrosion resistant for longer life

The Hauck direct drive Turbo Blower is available in six pressure ranges from 12–36 osig (5.2–15.5 kPa) and 63 different sizes ranging from 240 to 13,000 scfm (6.4–348 nm³/min) for providing large or small volumes of air at constant pressures. The Turbo Blower is designed to supply air for combustion or for any low pressure air application.

Combustion Excellence Since 1888

TBA-1

Hauck manufactures an extensive line of fiberglass turbo blowers. Originally designed to provide combustion air, TBA blowers can be used on any application requiring low pressure air, such as: aerating, cooling, cleaning, conveying, fluidizing, exhausting, spraying, drying, ventilating, and agitating. The larger units provide both the increased capacity needed for larger furnaces as well as the higher pressures necessary for recuperation and flame shaping. Maximum inlet temperature is 200 °F (93 °C).

All Hauck Turbo Blowers have the integral molded scroll design and turbine bladed impeller that has proven itself so well over the years. The blowers produce efficiencies up to 50% over conventional blowers—efficiencies that mean savings in both initial and operating costs. Hauck TBA units can frequently meet your air volume and pressure requirements with a smaller horsepower than conventional blower equipment. Because of the increased efficiency, power consumption is reduced by several horsepower, reducing operating costs. TBA blowers are available with high efficiency or special duty motors.

The simple removal of eight bolts allows the casing and discharge to be rotated to any of seven positions. The rotation can easily be completed without disassembly of the casing. A steel inlet guard is furnished as standard equipment. If a motor replacement is ever necessary, standard shaft 'T' frame motors can be purchased locally, eliminating down time awaiting a special motor. Impellers balanced to ISO 1940 balancing standards minimize vibration to significantly increase the operational life of the blower. All Hauck Turbo Blowers are thoroughly tested prior to shipment.

A complete line of accessories is available which can adapt the Hauck Turbo Blower to almost any piping condition or operational requirement: inlet filters, silencers, combination filter-silencers, blast gates, transitions, starters, adapters, and more. Hauck Anti-Surge Control Systems (ASC) are available for new or existing installations where piping length or other conditions induce blower surge.

The above composite table shows density correction factors for temperature and altitude. Performance ratings shown in this bulletin have been calculated for standard air density of .075 lb./cu. ft. (70 °F @ 29.92 in. Hg barometric pressure). When density is other than standard, corrections for pressure and horsepower must be made.

Example: Requirement—a blower to deliver 3850 cfm at 16 osi pressure at 120 °F and 2500 ft. altitude.

1. Density Correction table indicates a factor of 1.20 for 120 °F and 2500 ft. altitude.

2. 16 osi x 1.20 = 19.2 osi.
3. From capacity table on Page 3, select model TBA-20-30 (1.0 S.F.) showing a capacity of 3850 cfm @ 20.8 osi requiring a 30 HP motor at standard air.
4. Divide pressure and HP shown by 1.20 for performance at elevated temperature and altitude. Correct selection will deliver 3850 cfm at 17.3 osi at 120 °F and 2500 ft. altitude with a 25 HP motor. Select a TBA-20-30 with a 25 HP motor unless unit must start up cold, in which case use of a 30 HP motor is required.

34	58.82	70	121.10	34	19.65	70	40.46

Lighter weight, corrosion resistance and a precisely molded involute scroll design are all made possible with the fiberglass casing. In addition, the molded rubberized lining provides abrasion resistance greater than steel and a super smooth surface for reduced frictional losses. Maximum inlet air temperature 200 °F (93 °C) .

The riveted, heavy gauge aluminum turbine type impeller utilizes a curved blade design which induces air into the blower inlet and improves efficiency.

If a motor replacement is ever necessary, standard shaft 'T' frame motors can be purchased locally and eliminate 'downtime' awaiting a special motor.

The simple removal of eight bolts allows the casing and discharge to be rotated to any of seven positions. This rotation can be easily completed without disassembly of the casing.

Turbine Design Impeller
(Pat. No. 3,472,967)

Inlet Turning Ring Seal
(Pat. No. 3,572,963)

The exclusive curved impeller with built-in air inducer is coupled with a patented inlet turning ring seal to produce operating efficiencies that have been previously unobtainable in Turbo Pressure Blowers. A steel inlet guard is furnished as standard equipment (not shown).

SILENCERS

The Hauck Inlet Silencer is specifically engineered to provide noise attenuation in the 63 Hz to 8,000 Hz frequency range. The design and the construction materials used ensure a long, trouble-free service life. Pressure drop is less than 1" wc (249 Pa). Use of a studded flange simplifies attachment to the blower. (See Hauck Sheet TBFS-1)

FILTERS

The Hauck Filter is designed for blowers installed in a dirty atmosphere to prevent dirt from being drawn into the blower and air piping system. The use of an inlet filter can often prevent unbalanced impellers and inefficient blower operation. Minimal pressure drop. Compatible with Hauck Silencers. (See Hauck Sheet TBFS-1)

TRANSITIONS, INTAKE ADAPTERS

All sizes and types of transition pieces are available to facilitate connecting the blower outlet to the system piping. The transition inlet is designed to fit the blower sleeve while the outlet is available with flanged, welded, threaded, or straight connections. An inlet adapter is available for applications where outside or 'fresh air' must be piped to the blower inlet. Adapter is complete with gasket and necessary fasteners.

ANTI-SURGE CONTROLS

The Hauck Anti-Surge Control System is composed of a variable vane damper that is attached to the turbo blower inlet flange. Vane position is automatically determined by the system demand. Blower surge is automatically controlled by modulating the pressure drop across the inlet dampers, maintaining a constant discharge pressure. Vane pre-swirl reduces blower HP at part load, and generates a different performance curve at each damper position. This technique, applicable to new or existing installations alike, maintains the flow through the system ABOVE the flow that would allow surging. Additional information on operational theory and application is available in Hauck Application Sheet GJ61.

HIGH EFFICIENCY AND SPECIAL DUTY MOTORS (Optional)

VIBRATION ISOLATORS

BLAST GATES

ORDERING INFORMATION

To insure prompt and accurate processing of your order, the following information is required:

1. Catalog Number—from Capacity Table.*
2. Discharge Position—from Dimensional Drawing (Discharge Position 1 supplied if not specified).

* Selection information for special altitude or inlet air temperatures condition is presented on page 6.

3. Motor Type—ODP or TEFC. High efficiency or special duty motors (Optional).
4. Electrical Specification—Voltage and Phase—All blowers use 60 Hz 3600 rpm standard shaft motors.
5. Optional Accessories Desired (See TBFS-1).**

** Select accessories compatible with inlet and discharge sizes listed in columns O,R, and S in Dimensional Data. (See page 5).
