

## Discover how to meet ever-changing global emissions requirements

OEM furnace builders and end users who want to upgrade their heat treatment processes today face multiple operating challenges. Not only are they under pressure to optimize performance and minimize waste, but they must meet increasingly stringent NOx emissions regulations and standards in every market in which they do business. Furthermore, it can be difficult to focus on these necessities while delivering the process and product quality required for commercial success.

This white paper explores the complexities OEMs and end users face in meeting ever-changing global emissions requirements and offers practical guidance on selecting the right burner and control combination for specific industrial heating applications.
